What's New In MyDynIPPro?

myDynIPPro is a multifunctional software application that allows a website administrator to effortlessly monitor and manage network, DNS and IP addresses from a web browser using a URL, and from a command line using a CLI. myDynIPPro is a remote monitoring and high availability solution for a domain name and an Internet protocol. myDynIPPro provides a command line tool that allows to administrate and maintain Internet Protocol (IP) and Domain Name System (DNS) configurations, as well as to manage the reliability and the functionality of a local DNS server.

myDynIPPro provides a web-browser frontend that allows domain administrators to manage a domain name and a DNS server without the need to run any command line interface. myDynIPPro is able to read the IP address stored in a domain name file and can update this information if necessary. myDynIPPro is an open-source software application and is based on the PERL programming language. myDynIPPro includes a large number of predefined configurations. It allows the automation of IPv4 and IPv6 assignments, the monitoring of a domain name and a DNS server, the management of the reliability and the functionality of a local DNS server.

myDynIPPro is a perfect solution for those companies that want a reliable, scalable and simple way to remotely monitor and manage Internet Protocol (IP) and DNS configurations. myDynIPPro, can be installed and run as a local DHCP server for automatically distributing IP addresses to computers connected to a local area network. myDynIPPro also allows to manage a domain name and a DNS server without the need to run any command line interface and using a web-browser interface.

myDynIPPro is a small, customizable, easy to configure and deploy, software application. Reviews and Verdict DynDNS is a fairly good utility with some limitations, but not bad. We have provided a Verdict Rating and List of Pros and Cons. Pros: Very

easy to install, and run; monitor for outage and downtime problems with the API; monitor and update DNS domain name. Cons: One limitation, it does not monitor traffic; no GUI, you have to use the command line; quite old-fashioned, the HTML and the CSS are not compatible with most of the modern browsers; does not resolve domain names from external IPs; no dynamic DNS system. Summary: DynD

System Requirements For MyDynIPPro:

PC: (Mac OSX Version also supported) - Windows 8 / 7 / Vista / XP / 2000 - 4 GB of RAM (8 GB recommended) - 2 GB of available space - Nvidia Geforce 8400 GS or equivalent card with 1GB or greater VRAM is recommended. Possible Display Requirements: - Display with at least 1280x720 - MST (multi-stream transport) Additional Notes: - Laptop in laptop mode (CLS-CLS+D)
